

MANUAL THESIS

Turning data chaos into controlled shared workflow state.

Current manual is too page/table/screenshot led; target manual must make cross-role collaboration and controlled visibility the primary structure.

Generated: 2026-06-17

ENGINE_MIX_V2_CODEX_V3_PROOF

EXECUTIVE ORIENTATION

What AlphaVest coordinates

AlphaVest WealthOS Collaborative Workflow User Manual V3 explains AlphaVest as a collaboration system, not as a catalogue of screens. The product value is that multiple roles can move from fragmented inputs to reviewed, released, evidenced, and auditable outcomes without confusing internal progress with client-visible advice.

DIGITAL FIRST Work enters the system as structured tenant, profile, entity, document, message, signal, decision, or export context.	HUMAN REVIEWED Analysts, advisors, compliance, privacy, and security each inspect the part of the workflow they are responsible for.	EVIDENCE BACKED Important actions create traceable proof so future reviewers know why the workflow advanced.	CLIENT RELEASE CONTROLLED Client visibility waits for the required release, permission, evidence, and sensitivity gates.
---	--	--	--

D-001. Global workflow lifecycle

01 Input	02 Normalization	03 Review
04 Gate	05 Visibility	06 Decision
07 Evidence	08 Audit	09 Monitoring

The lifecycle shows how raw material becomes reviewed, gated, visible, decided, evidenced, audited, and monitored. It matters because a user action in AlphaVest often prepares the next role rather than finishing the entire workflow.

TABLE OF CONTENTS

Manual spine

This manual is organized by collaboration concept and workflow story. Tables and screenshots are supporting evidence, not the document structure.

CHAP TER	TITLE	PURPOSE
1	What AlphaVest Coordinates	Explain data chaos, shared state, and why collaboration is the product value.
2	The Collaboration Model	Introduce Input -> Normalization -> Review -> Gate -> Visibility -> Decision -> Evidence -> Audit -> Monitoring.
3	Roles and Relays	Explain how each role changes what the next role sees.
4	Workflow Stories	Use the ten end-to-end stories as the main manual body.
5	Visibility and Client Release	Explain internal progress versus client-visible outcomes.
6	Evidence, Audit, and Blocked States	Explain proof, lineage, and protective stops as normal work.
7	State Transition Atlas	Document important lifecycle states and who can move them forward.
8	Screen Evidence Appendix	Use screenshots as proof of workflow viewpoints, not as the table of contents.
9	Demo Boundary and Implementation Limits	Separate navigable demo UI from production persistence claims.
10	Future PDF Production Notes	Guide layout, diagrams, callouts, and story-first rendering.

9	13	10	8
collaboration stages	role relays	workflow stories	state groups

COLLABORATION MODEL

How work moves through AlphaVest

Every important flow follows the same pattern: a role introduces or improves an object, the system changes state, the next role sees a controlled view, and evidence or audit explains why the relay is legitimate.

01

INPUT

Tenant, profile, entity, document, message, or request data

Roles

Principal, Family CFO, Client, External Advisor, Ops Admin

State movement

draft/new/empty -> submitted/uploaded/onboarding

Other roles see

Internal teams see a scoped work item, data gap, or review-ready object inside the tenant context.

02

NORMALIZATION

Raw profile fields, entity details, extraction output, trigger context, or queue item

Roles

Analyst, Client Success, System

State movement

submitted/uploaded/ai_extracted -> analyst_review/client_confirm/in_review

Other roles see

Reviewers see structured context instead of raw fragments: who owns it, what

03

REVIEW

Normalized signal, document, recommendation candidate, export scope, or governance request

Roles

Analyst, Advisor, Compliance, Privacy Officer

State movement

analyst_review -> advisor_review/compliance_pending/needs_evidence

Other roles see

The next role sees why the item is ready, what evidence supports it,

Protected from view	Advice-like conclusions, unreleased recommendations, restricted documents, and unapproved exports remain hidden.	Protected from view	is missing, what is sensitive, and what action is next. Client-facing advice, compliance release, and final evidence packages remain unavailable.	Protected from view	and which gate still controls visibility. Client-visible release stays blocked until compliance and permission conditions are satisfied.
----------------------------	--	----------------------------	---	----------------------------	--

04

GATE

Advice-like recommendation, sensitive access change, export package, or client-visible message

Roles Compliance, Security, Privacy Officer

State movement compliance_pending/approval_required -> released/blocked/needs_evidence

Other roles see Approved material becomes available to the correct downstream role;

05

VISIBILITY

Released recommendation, decision, evidence record, message, or export

Roles Compliance, Permission engine, Client-facing roles

State movement internal_only/advisor_visible/compliance_visible -> client_visible or redacted

Other roles see Clients see only released, scoped, or redacted material; internal

06

DECISION

Released decision object with evidence context

Roles Principal, Family Council, Trustee scope d

State movement released_to_client -> accepted/deferred/rejected/evidence_create d/review_scheduled

Other roles see Advisor, compliance, and operations see the decision outcome, evidence

Protected from view	blocked items return with a reason and next legitimate action. Anything blocked, restricted, or redacted remains hidden from unauthorized roles.	Protected from view	al teams see full lineage and control history. Internal notes, unrelated drafts, raw extraction data, and restricted evidence remain internal.	Protected from view	link, and review cadence. Unrelated internal review notes and restricted evidence remain hidden.

07

EVIDENCE

Decision, compliance release, document, approval, communication, export, or audit event

Roles Analyst, Advisor, Compliance, Privacy Office, System

State movement initial evidence stub/created -> linked/validated/released/restricted

Other roles see Each role sees proof appropriate to its permission and visibility

08

AUDIT

Sensitive action, state transition, release, block, export, access change, or denied action

Roles Security, Compliance, Ops, Product, QA

State movement action attempted -> audit result success/denied/blocked/failed/pending/warning

Other roles see Control owner sees lineage, result, actor role, target object, previous state,

09

MONITORING

Queue item, SLA breach, data quality issue, roadmap scope, or state reference

Roles Ops, Product, QA, Leads

State movement open/in_review/blocked -> resolved/deferred/escalated/completed

Other roles see Teams see where workflow friction

accumulates and which service or product action should follow.

Protected from view Reference

Protected from view	ty scope. Highly restricted or internal-only evidence is hidden or redacted.	Protected from view	next state, and reason . Audit details remain internal unless released as an approved evidence or export item.	and operational pages remain internal-only.

ROLE RELAY MODEL

Who changes what the next role can see

These relays make collaboration explicit. They show where a workflow crosses from one role lens into another and why that handoff protects visibility, release, and accountability.

RR-001

PLATFORM ADMIN -> COMPLIANCE

Platform policy baseline

Why first role acts	The platform role establishes the rule set that later tenant, evidence, export, and release workflows inherit.
What changes	Policy settings move from draft or review candidate into a reviewed baseline.
Next role sees	Compliance sees advice-boundary, evidence, release, and export rules that determine whether later work can become client-visible.
Client visibility impact	Indirect but foundational: later client visibility depends on this baseline.

RR-002

COMPLIANCE -> SECURITY OFFICER

Sensitive platform controls

Why first role acts	Compliance confirms the policy meaning; security confirms access, session, and second-confirmation controls.
What changes	Sensitive configuration remains blocked until confirmation and audit expectations are satisfied.
Next role sees	Security sees which policy areas affect permission, MFA/session, external access, and export behavior.
Client visibility impact	Prevents unsafe visibility defaults from being inherited by tenants.

RR-003**OPS ADMIN -> CLIENT SUCCESS****ClientTenant onboarding**

Why first role acts	Ops creates the tenant shell so a family office can be configured in a scoped environment.
What changes	Tenant moves from draft to onboarding readiness.
Next role sees	Client Success sees owner assignments, missing activation gates, invitation readiness, and tenant policy profile.
Client visibility impact	No client-facing workspace is reliable until activation gates are satisfied.

RR-004**CLIENT SUCCESS -> INVITED USER****Invitation and onboarding consent**

Why first role acts	Client Success sends the invitation only after tenant setup has enough owner, policy, and role context.
What changes	User moves from invited toward active/demo role-confirmed state.
Next role sees	The invited user sees identity, privacy acknowledgement, consent, and role confirmation surfaces.
Client visibility impact	Creates scoped access context for later client-side visibility.

RR-005**PRINCIPAL / FAMILY CFO -> ANALYST****Client profile and family context**

Why first role acts	Client-side roles provide facts, relationships, preferences, and structure context that internal teams cannot safely infer.
What changes	Profile and relationship data become reviewable tenant context.
Next role sees	The analyst sees a structured family context with missing evidence, conflicts, and review needs.
Client visibility impact	Client input can remain visible to the client, but internal interpretation and advice remain gated.

RR-006**ANALYST -> ADVISOR****Entity, document, signal, or recommendation candidate**

Why first role acts	Analysts normalize data chaos into structured, reviewable context before advisory judgement is applied.
What changes	Workflow moves from analyst review toward advisor review or awaiting information.
Next role sees	Advisor sees the candidate package, source context, evidence status, and unresolved blockers.
Client visibility impact	Advisor approval is internal human review, not client visibility.

RR-007**CLIENT / EXTERNAL ADVISOR -> ANALYST****Document upload and extraction**

Why first role acts	The source document enters the system from the party that has it, but extracted values must be reviewed before they become trusted context.
What changes	Document moves uploaded -> ai_extracted -> client_confirmed -> analyst_review_pending.
Next role sees	Analyst sees document type, sensitivity, extracted values, confidence, corrected values, and entity links.
Client visibility impact	Clients may see simplified document state; internal extraction detail is not automatically client-visible.

RR-008**ADVISOR -> COMPLIANCE OFFICER****Advisor-approved recommendation package**

Why first role acts	Advisor review supplies human judgement and rationale, but the package still requires release control.
What changes	Recommendation moves advisor_approved -> compliance_pending.
Next role sees	Compliance sees advisor rationale, evidence completeness, classification, permissions, and release/block controls.
Client visibility impact	This relay is the decisive client-visibility gate.

RR-009**COMPLIANCE OFFICER -> PRINCIPAL /
FAMILY COUNCIL / TRUSTEE SCOPED****Released client decision**

Why first role acts	Compliance releases only the version that is safe, scoped, evidenced, and permitted for client review.
What changes	Decision moves released_to_client -> awaiting_family_approval or decision-ready.
Next role sees	Client-side participants see the released decision, evidence summary, required participants, and accept/defer/reject controls.
Client visibility impact	Client visibility is now permitted but still role/participant scoped.

RR-010**PRINCIPAL / ADMIN -> COMPLIANCE /
SECURITY****Governance access request**

Why first role acts	A user or admin requests changed access because collaboration requires the right people to see the right objects.
What changes	Access request moves requested -> in_review -> approved/blocked/revoked.
Next role sees	Compliance/Security sees requester, target user, scope, sensitivity, reason, and second-confirmation need.
Client visibility impact	Access changes alter who can see client-visible, restricted, or internal objects later.

RR-011**ADVISOR / CLIENT SUCCESS -> CLIENT**
Communication escalation

Why first role acts	The internal team chooses the right channel when digital-only work is no longer enough.
What changes	Communication moves draft/scheduled -> sent/completed/evidence-linked when material.
Next role sees	Client sees only the approved or appropriate message/call context, not internal notes.
Client visibility impact	Channel choice determines what is client-visible and what remains internal service context.

RR-012**ADVISOR / COMPLIANCE -> PRIVACY OFFICER****Export request and redaction**

Why first role acts	The business wants to share evidence or decision material outside the live UI, but export creates risk.
What changes	Export request moves draft -> scope_selected -> redaction_pending -> approval_required/approved -> generated/downloaded.
Next role sees	Privacy Officer sees export type, scope, redaction profile, external sharing context, expiry, and approval state.
Client visibility impact	Exports create a controlled external visibility surface separate from the app UI.

RR-013**OPS -> PRODUCT / QA / LEADS****Queue, SLA, roadmap, and state friction**

Why first role acts	Ops observes bottlenecks and service friction that reveal where the workflow model needs improvement.
What changes	Queue/data quality issue moves open -> in_review/blocked/resolved/deferred.
Next role sees	Product and QA see which states, queues, or routes create friction and which gaps are implementation limits.
Client visibility impact	Mostly internal; improves future consistency and reduces client-facing confusion.

CORE SWIMLANES

Collaboration flows that carry the manual

D-002. Trigger to client decision

The flow shows why signal handling, advisor approval, compliance release, and client decision are distinct workflow events.

D-003. Document intake handoff

The flow shows how an uploaded source becomes trusted evidence only after classification, confirmation, and review.

D-004. Tenant onboarding relay

The flow shows tenant activation as a governed collaboration container, not only an account setup task.

D-005. Evidence and audit lineage

Evidence is assembled from workflow events, so a later reviewer can understand what happened before they entered the flow.

D-006. Visibility and release gate model

The chain is conjunctive: client visibility is allowed only when review, release, evidence, and permission conditions align.

This diagram turns the no-unapproved-advice rule into a business-readable control model. Advisor approval alone is useful internal review, but it is not the client release event.

WORKFLOW STORY WS-001

Tenant becomes operational

WORKFLOW PURPOSE A family-office workspace can become active before ownership, compliance, policy, and invitation context are aligned.	ROLES INVOLVED Platform Admin, Ops Admin, Client Success, Compliance, Invited User	READER TAKEAWAY A tenant is not just a record. It is the scoped collaboration container that makes later visibility and accountability possible.	
HANDOFF SEQUENCE - Platform Admin establishes baseline - Ops Admin creates tenant - Client Success coordinates readiness - Compliance confirms owner/policy gates - Invited User accepts and acknowledges scope	STATE CHANGES - TenantStatus: draft - TenantStatus: onboarding - UserStatus: invited - UserStatus: active/demo-confirmed	VISIBILITY CHANGES - Internal setup visible to AlphaVest roles - Invited user sees only onboarding context - Client workspace is not treated as operational until gates are satisfied	EVIDENCE AND AUDIT - Policy changes audit - Tenant create/team assignment audit expected - Invitation and consent audit expected

REQUIRED INPUTS AND OBJECTS

PolicyDefinition, ClientTenant, User, UserRole, AuditEvent

WHAT THE SYSTEM PREVENTS

tenant activation without required owners,role context without invitation/consent,unscoped client data

Evidence panel 1: Show policy baseline, tenant readiness, and invitation as one activation relay. Role viewpoint: Platform/Ops/Invited User. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: The UI is navigable with demo data; broad persisted tenant governance transactions are not fully claimed.

WORKFLOW STORY WS-002

Client profile becomes usable shared family context

WORKFLOW PURPOSE

Family information, relationships, governance roles, and objectives often sit in separate memories, emails, spreadsheets, and documents.

ROLES INVOLVED

Principal, Family CFO, Analyst, Advisor

READER TAKEAWAY

The wealth map is not decoration. It is a shared model that tells every role what the family structure currently means and where uncertainty remains.

HANDOFF SEQUENCE

- Principal or Family CFO submits context
- Analyst validates and flags gaps
- Advisor reviews governance significance

STATE CHANGES

- WorkflowStatus: draft/new
- WorkflowStatus: in_review
- WorkflowStatus: awaiting_info or completed

VISIBILITY CHANGES

- Client-side profile input remains tenant-scoped
- Analyst sees quality gaps and relationship context
- Advisor sees decision-relevant context only after review

EVIDENCE AND AUDIT

- Profile edits should audit when material
- Missing evidence creates review tasks or data quality issues

REQUIRED INPUTS AND OBJECTS

ClientTenant, FamilyMember, Relationship, Entity, Asset, DataQualityIssue

WHAT THE SYSTEM PREVENTS

advisory work based on memory alone,unreviewed relationships driving decisions,hidden conflicts in family/entity structure

Evidence panel 2: Show client context and wealth structure becoming shared review material. Role viewpoint: Principal/Analyst/Advisor. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Profile and relationship screens are navigable with demo data; full persistence is still a stated implementation need.

WORKFLOW STORY WS-003

Document chaos becomes verified evidence

WORKFLOW PURPOSE Documents arrive from different people, in different formats, with uncertain sensitivity, entity links, and extracted facts.	ROLES INVOLVED Client, Family CFO, External Advisor, Analyst, Compliance	READER TAKEAWAY A document becomes useful only when it is classified, checked, linked, and made available at the correct visibility level.	
HANDOFF SEQUENCE • Client or advisor uploads source • System/extraction drafts structure • Client confirms or corrects • Analyst validates • Evidence receives verified source link	STATE CHANGES • DocumentStat us: empty • uploading • uploaded • ai_extracted • client_confirmed • analyst_review_pending • verified or needs_clarification or blocked • linked_to_evidence	VISIBILITY CHANGES • Uploader sees upload/confirmation state • Analyst sees extraction detail • Compliance sees evidence readiness when relevant • Restricted documents remain scoped	EVIDENCE AND AUDIT • Upload, extraction review, versioning, correction, verification, and evidence linking should be auditable

REQUIRED INPUTS AND OBJECTS

Document, DocumentVersion,
DocumentExtraction,
DocumentReview, DocumentLink,
EvidenceRecord

WHAT THE SYSTEM PREVENTS

low-confidence extraction
becoming accepted fact,restricted
document exposure,unlinked
evidence claims

Evidence panel 3: Show document inventory and evidence vault as the conversion from file to proof. Role viewpoint: Client/Analyst/Compliance. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: The manual documents demo UI and workflow intent; no real file storage or extraction transaction is claimed.

WORKFLOW STORY WS-004

Signal becomes reviewed recommendation candidate

WORKFLOW PURPOSE A signal, data gap, market prompt, or document expiry can be mistaken for advice if review boundaries are not explicit.	ROLES INVOLVED System, Analyst, Advisor	READER TAKEAWAY The system keeps signals useful without letting them masquerade as advice.	
HANDOFF SEQUENCE • Signal enters queue • Analyst classifies and routes • Advisor receives a prepared candidate package	STATE CHANGES • WorkflowStatus: new • analyst_review • awaiting_info or advisor_review • RecommendationStatus: advisor_pending	VISIBILITY CHANGES • Signal and draft remain internal • Advisor sees review context • Client sees nothing advice-like yet	EVIDENCE AND AUDIT • Routing, request-data, and recommendation-prep actions should create traceable events

REQUIRED INPUTS AND OBJECTS

Trigger, ActionItem,
Recommendation, Approval,
AuditEvent

WHAT THE SYSTEM PREVENTS

AI draft or signal becoming client
advice,analyst review being
treated as release,unsupported
advisor package

Evidence panel 4: Show internal-only signal review and advisor package before release. Role viewpoint: Analyst/Advisor. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: The J01 subset has demo-executable workflow actions; broad signal governance remains partial.

WORKFLOW STORY WS-005

Advisor-approved package becomes compliance-controlled client visibility

WORKFLOW PURPOSE Advisor approval can feel final, but in a regulated wealth workflow it cannot be the same as client release.	ROLES INVOLVED Senior Wealth Advisor, Compliance Officer, Principal	READER TAKEAWAY Client visibility is a controlled outcome, not a side effect of internal approval.	
HANDOFF SEQUENCE • Advisor records rationale • Compliance checks classification/evidence/permissions • Client visibility is released or blocked with reason	STATE CHANGES • RecommendationStatus: advisor_pending • advisor_approved • compliance_pending • released_to_client or blocked	VISIBILITY CHANGES • Advisor approval remains internal • Compliance sees release controls • Client visibility begins only after release and permission check	EVIDENCE AND AUDIT • Advisor approval, compliance release, block, and evidence request should all create audit lineage

REQUIRED INPUTS AND OBJECTS

Recommendation, Approval, ComplianceReview, EvidenceRecord, Permission

WHAT THE SYSTEM PREVENTS

unapproved advice reaching client,release without evidence,advisor approval being treated as final

Evidence panel 5: Show advisor approval and compliance queue as separate gates. Role viewpoint: Advisor/Compliance. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Release/block states are visible; broad release persistence remains a top implementation gap.

WORKFLOW STORY WS-006

Client decision becomes evidence and review cadence

WORKFLOW PURPOSE A client decision can disappear into email, meeting notes, or memory unless the decision, participants, rationale, and review date are captured together.	ROLES INVOLVED Compliance Officer, Principal, Family Council, Trustee scoped, Advisor	READER TAKEAWAY The client decision is not the end of the workflow; it becomes the start of evidence and future review discipline.	
HANDOFF SEQUENCE - Compliance releases safe decision - Client-side participant acts - Evidence captures decision outcome - Review cadence schedules follow-up	STATE CHANGES - DecisionStatus : released_to_client - awaiting_family_approval - accepted/deferred/rejected - evidence_created - review_scheduled	VISIBILITY CHANGES - Client sees released decision only - Advisor/compliance see outcome and evidence lineage - Restricted internal notes remain hidden	EVIDENCE AND AUDIT Decision action, reason, participant action, and evidence package should be immutable/audited

REQUIRED INPUTS AND OBJECTS

Decision, DecisionParticipant, EvidenceRecord, ReviewSchedule, AuditEvent

WHAT THE SYSTEM PREVENTS

unscoped participant decisions,lost decision rationale,completed decisions without proof

Evidence panel 6: Show released decision and evidence lineage. Role viewpoint: Principal/Family Council/Compliance. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Decision surfaces are navigable; final decision/evidence package persistence remains incomplete.

WORKFLOW STORY WS-007

Governance change becomes permission-safe access

WORKFLOW PURPOSE Family offices frequently need to adjust access, but access changes can silently overexpose sensitive client data.	ROLES INVOLVED Principal, Admin, Compliance, Security, External Advisor	READER TAKEAWAY Access is not a user setting. It is a governed collaboration boundary.	
HANDOFF SEQUENCE • Principal/Admin requests access • Compliance reviews purpose/scope • Security confirms sensitive changes • Audit history records lineage	STATE CHANGES • WorkflowStatus: new/requested • in_review • approved or blocked or revoked	VISIBILITY CHANGES • Requester sees request state • Reviewer sees sensitivity and scope • Target user sees only approved role scope	EVIDENCE AND AUDIT • Sensitive role/access actions require second confirmation and audit

REQUIRED INPUTS AND OBJECTS

UserRole, RolePermission,
AccessRequest,
SecondConfirmation, AuditEvent

WHAT THE SYSTEM PREVENTS

external broad access without
review,cross-tenant
exposure,permission changes
without audit

Evidence panel 7: Show access and governance as controlled collaboration boundary. Role viewpoint: Principal/Admin/Compliance/Security. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Demo actions are visible; governed access transactions remain incomplete.

Workflow collaboration manual

33 / 55

WORKFLOW STORY WS-008

Communication escalation becomes recorded service context

WORKFLOW PURPOSE Complex advisory work often shifts between digital messages, calls, workshops, and specialists without preserving why the channel changed.	ROLES INVOLVED Advisor, Client Success, Client, External Specialist, Compliance	READER TAKEAWAY Communication is part of the workflow state, not a side channel outside the system.	
HANDOFF SEQUENCE • Advisor/Client Success selects channel • Client responds or joins call • Material outcome links to evidence • Compliance controls advice-like messages when needed	STATE CHANGES • WorkflowStatus: draft • sent or scheduled • awaiting_reply • completed or escalated	VISIBILITY CHANGES • Client-visible messages are separated from internal notes • Material outcomes can become evidence-linked • Advice-like content remains release-controlled	EVIDENCE AND AUDIT • Sensitive communication should audit; material calls can link to evidence

REQUIRED INPUTS AND OBJECTS

MessageThread, Message,
CallEvent, EvidenceRecord,
AuditEvent

WHAT THE SYSTEM PREVENTS

unrecorded escalations,advice-like
messages without release
control,lost service context

Evidence panel 8: Show channel escalation as service workflow state. Role viewpoint: Advisor/Client Success/Client. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Communication surfaces are mostly static; message and call persistence is not claimed.

WORKFLOW STORY WS-009

Export request becomes redacted, approved, auditable package

WORKFLOW PURPOSE Exporting data can break the system's visibility controls if scope, redaction, approval, expiry, and audit are not explicit.	ROLES INVOLVED Advisor, Compliance, Privacy Officer, Client, External Advisor	READER TAKEAWAY An export is a controlled visibility event, not a simple download.	
HANDOFF SEQUENCE • Requester chooses scope • Privacy/Compliance reviews redaction and approval • Generated package becomes downloadable only if allowed • Audit captures export lifecycle	STATE CHANGES • ExportStatus: draft • scope_selected • redaction_pending • approval_required • approved • generated • downloaded or expired	VISIBILITY CHANGES • Internal evidence may become redacted package • External sharing has expiry and classification • Restricted material remains excluded	EVIDENCE AND AUDIT • Export create, scope, redaction, approval, generation, download, and share should audit

REQUIRED INPUTS AND OBJECTS

EvidenceRecord, ExportRequest, Document, AuditEvent, Permission

WHAT THE SYSTEM PREVENTS

unredacted data leaving the platform,permission-free downloads,external packages without expiry

Evidence panel 9: Use evidence/export surface to explain scoped redaction and auditable sharing. Role viewpoint: Advisor/Compliance/Privacy. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Export UI is navigable; file/share realism is a Phase 18 gap.

Workflow collaboration manual

37 / 55

WORKFLOW STORY WS-010

Ops monitoring turns workflow friction into service and product improvement

WORKFLOW PURPOSE Workflow friction often remains anecdotal: someone knows a queue is slow, but the system does not show where or why.	ROLES INVOLVED Ops, Product, QA, Leads	READER TAKEAWAY AlphaVest uses operations feedback to keep the workflow model honest and continuously improve the shared state.	
HANDOFF SEQUENCE • Ops monitors queues • QA validates coverage and state language • Product identifies roadmap or implementation gaps • Leads prioritize next workflow improvement	STATE CHANGES • WorkflowStatus: open • in_review • blocked • deferred • completed	VISIBILITY CHANGES • Operational pages remain internal • Workflow health informs product/service decisions • Client-facing promises are not inflated by reference pages	EVIDENCE AND AUDIT • Ops mutations should audit when implemented and service-affecting

REQUIRED INPUTS AND OBJECTS

QueueItem, DataQualityIssue, ReviewSchedule, AuditEvent

WHAT THE SYSTEM PREVENTS

invisible SLA drift,reference pages being mistaken for product capability,untracked data quality debt

Evidence panel 10: Show ops queues as workflow feedback and improvement surface. Role viewpoint: Ops/Product/QA. This panel supports the workflow explanation; it is not a route instruction.

Demo boundary: Queue/SLA mutation is not fully implemented; reference pages are internal only.

VISIBILITY AND RELEASE GATES

Why internal progress is different from client visibility

AlphaVest separates internal collaboration from client-visible release. Advisor approval is a human review step, but compliance release, evidence completeness, permission checks, and sensitivity boundaries decide whether a client can see or act on something.

D-006. Visibility and release gate model

The chain is conjunctive: client visibility is allowed only when review, release, evidence, and permission conditions align.

This diagram turns the no-unapproved-advice rule into a business-readable control model. Advisor approval alone is useful internal review, but it is not the client release event.

The matrix below is intentionally supporting material. It helps readers compare role visibility across objects, but it is not the main story of the manual.

SETUP AND CLIENT-SIDE VISIBILITY

OBJECT OR STATE	PLATFORM ADMIN	OPS ADMIN	CLIENT SUCCESS	PRINCIPAL
tenant	can create/review baseline	can create	can coordinate	blocked until invited
profile	internal only	summary only	can review onboarding context	can create/review
entity	internal only	summary only	summary only	can create/review
document	internal only	blocked unless scoped	summary only	can upload/review own
extraction	internal only	blocked	blocked	can confirm/correct if scoped
trigger	internal only	summary only	summary only	blocked unless neutral/released
recommendation	internal only	blocked	blocked/summary only	blocked until released
approval	audit-only	blocked	blocked	blocked
compliance review	audit-only	blocked	blocked	blocked until release
decision	audit-only	blocked	summary only if service scoped	can review/decide if released
evidence record	audit-only	blocked/summary only	summary only	client-visible/released only
export request	audit-only	blocked	blocked/summary only	can request if permitted
message thread	audit-only	blocked	can coordinate	client-visible messages only
access request	can review platform scope	can request/administer	can coordinate	can request/approve scoped
queue item	summary only	can monitor	can own service queue	blocked
data quality issue	summary only	can monitor	can coordinate	may see client-safe request

FAMILY, ANALYSIS, ADVICE, AND RELEASE

OBJECT OR STATE	FAMILY CFO	ANALYST	ADVISOR	COMPLIANCE
tenant	blocked until invited	can see assigned tenant	can see assigned tenant	can review/release gates
profile	can create/review if scoped	can review/flag gaps	can review after normalization	can review if sensitive
entity	can create/review	can review/link evidence	can review significance	can review if release-sensitive
document	can upload/review scoped	can review/verify	can review if permitted	can review sensitive/release evidence
extraction	can confirm/correct if scoped	can review/accept/block	summary only after review	review if evidence-sensitive
trigger	blocked unless neutral/released	can review/route	can review after routing	can review release-sensitive
recommendation	blocked until released	can draft/prepare	can approve/revise/request data	can release/block/request evidence
approval	blocked	can see status if assigned	can approve/revise	can review as release input
compliance review	blocked until release	can see request for evidence	can see release/block result	can release/block/request evidence
decision	can review/decide if participant	can see status if assigned	can review outcome	can review release/evidence
evidence record	client-visible/released only	can create/link	can review	can validate/release/restrict
export request	can request if permitted	can prepare if assigned	can request/review	can approve/block
message thread	client-visible messages only	internal notes if assigned	can send/review	release controls if advice-like
access request	can request if scoped	blocked	blocked/request scoped	can approve/block
queue item	blocked	can own analyst queue	can own advisor queue	can own compliance queue
data quality issue	may see client-safe request	can create/resolve	can review impact	can block release

PRIVACY, SECURITY, EXTERNAL SCOPE, AND QA

OBJECT OR STATE	PRIVACY OFFICER	SECURITY	EXTERNAL ADVISOR	PRODUCT / QA
tenant	internal only unless export/privacy	can review access/session controls	blocked until scoped	internal reference only
profile	can see privacy-sensitive summary	audit-only	see redacted/scoped only	demo/reference only
entity	redaction review	audit-only	scoped/redacted only	internal demo/reference
document	can review redaction	audit-only	can upload/review scoped	no real client data
extraction	review redaction sensitivity	audit-only	confirm if source owner	demo quality only
trigger	blocked unless export/privacy	audit-only	blocked	internal monitoring
recommendation	redaction/privacy review if exported	audit-only	blocked unless explicitly scoped	state reference only
approval	audit/redaction only	audit-only	blocked	state reference only
compliance review	can review redaction/privacy	audit-only	blocked	state reference only
decision	redacted/export review	audit-only	blocked unless scoped	state reference only
evidence record	can review redaction	audit-only	redacted/scoped only	no real client data
export request	can review redaction	audit-only	recipient/scoped only	state reference only
message thread	privacy review if needed	audit-only	scoped thread only	no client content
access request	review privacy scope	can confirm/deny	target/request scoped	state reference only
queue item	export/privacy queue	security queue	blocked	can monitor quality
data quality issue	review sensitive issue	audit-only	scoped request only	can analyze trend

EVIDENCE AND AUDIT LINEAGE

How AlphaVest preserves the reason a workflow advanced

Evidence lets a later reviewer understand what changed before they entered the flow. Audit events protect sensitive actions by preserving actor, role, object, previous state, next state, and result.

D-005. Evidence and audit lineage

Evidence is assembled from workflow events, so a later reviewer can understand what happened before they entered the flow.

REVIEW MEMORY Evidence connects decisions, releases, documents, exports, messages, and approvals into a coherent trace.	CONTROLLED CORRECTION Corrections create new events rather than silently rewriting what happened.	FUTURE COLLABORATION The next role can act with context instead of reconstructing the past from messages or memory.	CLIENT TRUST Released material has an explainable lineage instead of appearing as an unsupported conclusion.
--	--	--	---

STATE TRANSITION ATLAS

What states mean for collaboration

States are not technical labels in this manual. They explain whether an object is still being prepared, blocked for protection, ready for review, released to a client, or captured as evidence.

TENANTSTATUS Defines whether a tenant is merely configured, being onboarded, operational, paused, or no longer active. draft onboarding active suspended archived Who moves it forward Ops Admin, Client Success, Compliance What other roles see Client-side users see onboarding only after invitation; internal teams see readiness gates before activation. Evidence and audit Tenant create, owner assignment, policy override, activation, suspension, and archive should audit. Client visibility Client workspace visibility should not be treated as operational before activation gates.	DOCUMENTSTATUS Turns an untrusted file into reviewed source material or blocks it before it can support decisions. empty uploading uploaded ai_extracted client_confirmed analyst_review_pending verified needs_clarification blocked linked_to_evidence archived Who moves it forward Client, Family CFO, External Advisor, Analyst, Compliance What other roles see Uploader sees upload/confirmation; analyst sees extraction/review; compliance sees evidence suitability. Evidence and audit Upload, extraction correction, review, block, and evidence link should audit. Client visibility Raw extraction and internal review are not automatically client-visible.
--	--

WORKFLOWSTATUS

Generic lifecycle for action, queue, engagement, access, and service work.

draft	new	in_review	awaiting_info
analyst_review	advisor_review		
compliance_pending	ready_for_client		
client_visible	completed	deferred	blocked
rejected	archived		

Who moves it forward	Assigned owner, Analyst, Advisor, Compliance, Ops
What other roles see	Each role sees whether the next action is theirs, blocked, or waiting on someone else.
Evidence and audit	Material state transitions and sensitive actions should audit.
Client visibility	ready_for_client and client_visible are distinct from internal completion.

RECOMMENDATIONSTATUS

Separates draft/AI/internal review from advisor judgement, compliance release, and client action.

draft	ai_draft	analyst_reviewed
advisor_pending	advisor_approved	
revision_requested	more_data_requested	
compliance_pending	released_to_client	
blocked	client_accepted	client_deferred
client_rejected	archived	

Who moves it forward	Analyst, Advisor, Compliance, Client-side participant
What other roles see	Advisor sees prepared context; compliance sees release package; client sees only released recommendation/decision material.
Evidence and audit	Approval, revision, evidence request, release, block, and client outcome should audit.
Client visibility	advisor_approved is not client_visible; only released_to_client plus permission/evidence gates allows visibility.

COMPLIANCESTATUS

Controls whether sensitive/advice-like work can cross the internal-to-client boundary.

not_required	pending	in_review	released
blocked	needs_evidence	exception	expired

Who moves it forward Compliance Officer, Privacy Officer where relevant

What other roles see Advisor and analyst see release/block/evidence request outcome; client sees only released content.

Evidence and audit Release, block, exception, and evidence request are audit-critical.

Client visibility released is required for advice-like client-visible content.

DECISIONSTATUS

Tracks the client-side decision lifecycle after compliance release.

draft	released_to_client		
awaiting_family_approval	accepted	deferred	
rejected	evidence_created	review_scheduled	
archived			

Who moves it forward Compliance Officer, Principal, Family Council, Trustee scoped, System for evidence/review schedule

What other roles see Client-side participants see required actions; advisor/compliance see outcome and evidence status.

Evidence and audit Decision action, participant status, evidence creation, and review scheduling should audit.

Client visibility Decision becomes visible only after release; participant scope controls who can act.

EVIDENCESTATUS

Tracks whether proof exists, is linked, validated, releasable, restricted, or obsolete.

initial evidence stub	created	linked	validated
released	restricted	archived	superseded

Who moves it forward Analyst, Advisor, Compliance, Privacy Officer, System

What other roles see Each role sees the proof package according to visibilityStatus and permission.

Evidence and audit Evidence item linking, validation, release, restriction, and supersession should audit.

Client visibility Evidence can be client-visible, redacted, restricted, or internal-only.

EXPORTSTATUS

Controls how internal evidence or decision data leaves the platform as an auditable package.

draft	scope_selected	redaction_pending	
approval_required	approved	generated	
downloaded	expired	revoked	failed

Who moves it forward Requester, Advisor, Compliance, Privacy Officer, System

What other roles see Requesters see progress; approvers see scope/redaction; recipients see only approved package output.

Evidence and audit Export scope, approval, generation, download, expiry, and revocation should audit.

Client visibility Exports are a separate visibility surface and must preserve redaction, permission, classification, and expiry.

SCREEN EVIDENCE APPENDIX

Screenshots as workflow evidence

Each screenshot is tied to a workflow moment, role viewpoint, and handoff. The screenshot supports the explanation; it does not replace it.

WS-001			
TENANT BECOMES OPERATIONAL			
Show policy baseline, tenant readiness, and invitation as one activation relay.			
Role viewpoint	Platform/Ops/Invited User		
Handoff shown	policy -> tenant -> invitation		
What happened before	Platform Admin establishes baseline		
What happens next	Invited User accepts and acknowledges scope		

Appendix screenshot 1. Used as workflow evidence only.

WS-002

CLIENT PROFILE BECOMES USABLE
SHARED FAMILY CONTEXT

Show client context and wealth structure becoming shared review material.

Role viewpoint Principal/Analyst/Advisor

Handoff shown client input -> analyst review -> advisor context

What happened before Principal or Family CFO submits context

What happens next Advisor reviews governance significance

Appendix screenshot 2. Used as workflow evidence only.

WS-003

DOCUMENT CHAOS BECOMES
VERIFIED EVIDENCE

Show document inventory and evidence vault as the conversion from file to proof.

Role viewpoint Client/Analyst/Compliance

Handoff shown upload -> verify -> evidence

What happened before Client or advisor uploads source

What happens next Evidence receives verified source link

Appendix screenshot 3. Used as workflow evidence only.

WS-004

**SIGNAL BECOMES REVIEWED
RECOMMENDATION CANDIDATE**

Show internal-only signal review
and advisor package before
release.

Role viewpoint Analyst/Advisor
Handoff shown signal ->
analyst route -
> advisor
approval
**What happened
before** Signal enters
queue
**What happens
next** Advisor
receives a
prepared
candidate
package

Appendix screenshot 4. Used as workflow evidence only.

WS-005

**ADVISOR-APPROVED PACKAGE
BECOMES COMPLIANCE-
CONTROLLED CLIENT VISIBILITY**

Show advisor approval and
compliance queue as separate
gates.

Role viewpoint Advisor/Compliance
Handoff shown advisor-
approved ->
compliance-
controlled
**What happened
before** Advisor
records
rationale
**What happens
next** Client visibility
is released or
blocked with
reason

Appendix screenshot 5. Used as workflow evidence only.

WS-006

CLIENT DECISION BECOMES EVIDENCE AND REVIEW CADENCE

Show released decision and evidence lineage.

Role viewpoint Principal/Family Council/Compliance

Handoff shown release -> decision -> evidence

What happened before Compliance releases safe decision

What happens next Review cadence schedules follow-up

Appendix screenshot 6. Used as workflow evidence only.

WS-007

GOVERNANCE CHANGE BECOMES PERMISSION-SAFE ACCESS

Show access and governance as controlled collaboration boundary.

Role viewpoint Principal/Admin /Compliance/Security

Handoff shown request -> review -> audit

What happened before Principal/Admin requests access

What happens next Audit history records lineage

Appendix screenshot 7. Used as workflow evidence only.

WS-008

COMMUNICATION ESCALATION BECOMES RECORDED SERVICE CONTEXT

Show channel escalation as service workflow state.

Role viewpoint	Advisor/Client Success/Client
Handoff shown	digital -> call/escalation -> evidence context
What happened before	Advisor/Client Success selects channel
What happens next	Compliance controls advice-like messages when needed

Appendix screenshot 8. Used as workflow evidence only.

WS-009

EXPORT REQUEST BECOMES REDACTED, APPROVED, AUDITABLE PACKAGE

Use evidence/export surface to explain scoped redaction and auditable sharing.

Role viewpoint	Advisor/Compliance/Privacy
Handoff shown	evidence -> export scope -> redaction
What happened before	Requester chooses scope
What happens next	Audit captures export lifecycle

Appendix screenshot 9. Used as workflow evidence only.

WS-010

OPS MONITORING TURNS
WORKFLOW FRICTION INTO
SERVICE AND PRODUCT
IMPROVEMENT

Show ops queues as workflow
feedback and improvement
surface.

Role viewpoint Ops/Product/Q
A

Handoff shown queue friction -
> QA/product
action

**What happened
before** Ops monitors
queues

**What happens
next** Leads prioritize
next workflow
improvement

Appendix screenshot 10. Used as workflow evidence only.

PRODUCTION BOUNDARY

What this PDF claims and what it does not claim

GROUNDING CLAIM

The manual is generated from the collaboration source package and current repository documentation.

DEMO BOUNDARY

Some workflows are navigable with demo data but not claimed as fully persisted production transactions.

ACCESSIBILITY BOUNDARY

The PDF is text-extractable, but this Chromium generation is not claimed as tagged PDF/UA output.

OPERATIONAL USE

The manual should support onboarding, review, QA, and stakeholder explanation of collaboration mechanics.

PROOF POINTS FROM THE SOURCE PACKAGE

- JSON schema present
- 10 workflow stories present
- 13 role relays present
- 8 state groups present
- 6 diagram specs present

ADVERSARIAL QA FROM THE SOURCE PACKAGE

- Does not claim production persistence
- Does not make advisor approval equal client release
- Does not use URL paths as operating instructions
